Place Scans Auto, Place Scans, and Place Cluster Options Using SCENE

**Place Scans Auto** uses the full automatic features of SCENE to place all scans within the affected Scan folder (correspondence search based on the geometric relations + place scans).

**Forced by manual target names** uses the target names to assign correspondences instead of the geometric relations between the targets of different scans. The rest is the same as **Place Scans Auto**.

**Place Cluster** places the clusters relative to each other without affection the positions of the scans within these clusters.
